

BACnet Errata
ANSI/ASHRAE STANDARD 135.1-2019
A Data Communication Protocol for Building Automation and Control Networks

June 18, 2021

This document lists *errata additions* to ANSI/ASHRAE Standard 135.1-2019 as of the above date. Each entry is cited first by clause, then page number, except where an erratum covers more than one clause. The back page marking identifying the electronic publication of Standard 135.1-2019 is “Product code: D-86437 9/19”.

Changes are indicated by using ~~strikeout~~ for text to be removed and *italics* for text to be added, unless noted otherwise. Grey highlighting is used for marking small changes.

1) Clause 12.1.3.9 – Frame Type explicitly stated

12.1.3.9 Verify $T_{\text{usage_timeout}}$ w/ Serial Analyzer

...

Test Steps:

1. MAKE (Power on both devices.)
2. WAIT (several seconds)
3. VERIFY (Has Token passing been established between the devices?)
4. MAKE (Power off the other master device, but not the IUT.)
5. WAIT (10 seconds)
6. MAKE (Stop the data capture.)
7. CHECK (Did the IUT send a ~~type-0~~ Token frame to the other master, and, when the other master did not use the Token (because it was powered off), did the IUT follow the ~~type-0~~ Token frame with one ~~type-0~~ Token frame (Token retry) followed by a series of ~~type-1~~ Poll For Master frames?)
8. CHECK (Is the time difference between the last octet of the ~~type-0~~ Token frame sent by the IUT and the first octet of the immediately following ~~type-1~~ Poll For Master frame transmitted by the IUT greater than 20 milliseconds - $T_{\text{neg_err}}$ and less than 100 milliseconds + $T_{\text{pos_err}}$?)
9. CHECK (Is the time gap (last character to first character) between any two ~~type-1~~ Poll For Master frames (~~Poll For Master~~) sent by the IUT greater than 20 milliseconds - $T_{\text{neg_err}}$, but less than 100 milliseconds + $T_{\text{pos_err}}$?)

2) Clause 12.1.3.3 – Should not require a Data Frame

12.1.3.3 Verify $T_{\text{frame_gap}}$

Purpose: Verify that the maximum idle time between ~~data~~ octets when transmitting a frame is 20 bit times or less.

Test Steps:

1. Elicit the transmission of any ~~data~~ frame from the IUT.
2. Measure the longest EIA-485 idle time that appears between octets within the ~~data~~ frame transmitted by the IUT. If there is no idle time between octets, pass the IUT.
3. Fail the IUT if the time measured in step 2 is greater than the time intervals shown below for each baud rate.

9600 baud:	fail if interval is greater than 2,083 microseconds
19200 baud:	fail if interval is greater than 1,042 microseconds
38400 baud:	fail if interval is greater than 521 microseconds
57600 baud:	fail if interval is greater than 347 microseconds
76800 baud:	fail if interval is greater than 261 microseconds
115200 baud:	fail if interval is greater than 173 microseconds
x baud:	fail if interval is greater than (20/x) seconds

3) Document to PDF Conversion failed for Some '≥' and '≤' Characters

9.1.1.10

...

Test Concept: An event is triggered and the IUT notifies the TD and one other device. The TD acknowledges the event and verifies that the acknowledgment is properly noted by the IUT. The IUT notifies all recipients that the event has been acknowledged. The TD then acknowledges the event again, and the IUT again notifies all recipients. This behavior was not defined before Protocol_Revision 7 and so this test shall only be performed if Protocol_Revision is present (i.e., Protocol_Revision $\geq$ 7).

...

Test Concept: An event is triggered and the IUT notifies the TD and one other device. The TD acknowledges the event and verifies that the acknowledgment is properly noted by the IUT. The IUT notifies all recipients that the event has been acknowledged. The TD then acknowledges the event again, and the IUT again notifies all recipients. This behavior was not defined before Protocol_Revision 7 and so this test shall only be performed if Protocol_Revision is present (i.e., Protocol_Revision $\geq$ 7).

9.21.1.4

...

1. TRANSMIT ReadRange-Request,
 - 'Object Identifier' = (the log object configured for this test),
 - 'Property Identifier' = Log_Buffer,
 - 'Reference Time' = (any value x: x is older (of earlier time) than the time of an entry in the buffer which has a sequence number of S, and x is newer than or equal to the time of any preceding entry),
 - 'Count' = (any value y: $0 < y \leq \text{Total_Record_Count} - S + 1$)

9.21.1.4.1

...

1. TRANSMIT ReadRange-Request,
 - 'Object Identifier' = (the log object configured for this test),
 - 'Property Identifier' = Log_Buffer,
 - 'Reference Time' = (x, selected as described above),
 - 'Count' = (any value y: $0 < |y| \leq \text{number of records in the buffer}$)

13.2.2**13.2.2 TimeSynchronization Recipients Test, Protocol_Revision $\geq$ 7**

...

13.2.6

Dependencies: 13.2.2, "TimeSynchronization Recipients Test, Protocol_Revision $\geq$ 7".

...

13.8.2.1

...

Backup Characteristics:

...

8. The TD is configured with a Protocol_Revision $\geq$ 10. This is only used if the IUT claims Protocol_Revision $\geq$ 10.

Restore Characteristics:

...

8. The TD is configured with a Protocol_Revision $\geq$ 10. This is only used if the IUT claims Protocol_Revision $\geq$ 10.
